

Michael Borgese

The waterfall method and agile development are two methods that are used to develop software. The main difference between the two is when the systems are tested. Using the waterfall method the software is created in full and then the system is tested. After being tested it goes back to development and once the problems are fixed the software is tested again. While, agile development uses testing while the software is still in production. In other words the software is only partially complete when it begins to go through testing phases. That is the main difference between the waterfall method and agile development.
